What is a Data Space?

A **data space** is a **logical partition** of data in the cloud. It is a way to **organize and separate data** based on business needs.

You can create data spaces to separate:

- Different **departments** (like HR, Sales, Finance)
- Different **regions** (like Europe, Asia, US)
- Different **companies or partners**
- Or any other way your business needs to manage data
- **By default**, everything is stored in the **"Default Data Space."**
- You can assign a data space from the **permission sets.**
